

Interactive Storytelling Architecture for Training

Brian Magerko

Bob Wray

Additional project contributors:
Lisa Holt, Brian Stensrud

MICHIGAN STATE

UNIVERSITY

Motivation

- Training systems often use “pre-canned” exercises
 - Limited interest of student (poor motivation)
 - Limited training value (slow learning curve)
- Hypothesis:
 - Improve both interest (engagement) and training effectiveness by inserting an intelligent controller (director) into virtual training systems

Intelligent tutoring in unstructured domains

ISAT

- Based on work done with Interactive Drama Architecture (IDA)
 - Director as scenario manager
 - Author as trainer
- Provides individualized training experience
 - Trainee aptitude in skills
 - Drama
- Explores application of interactive storytelling techniques to training

Environment

U.S. ARMY

91W10 HEALTHCARE SPECIALIST COURSE

Advance Knowledge and Skills Acquisition

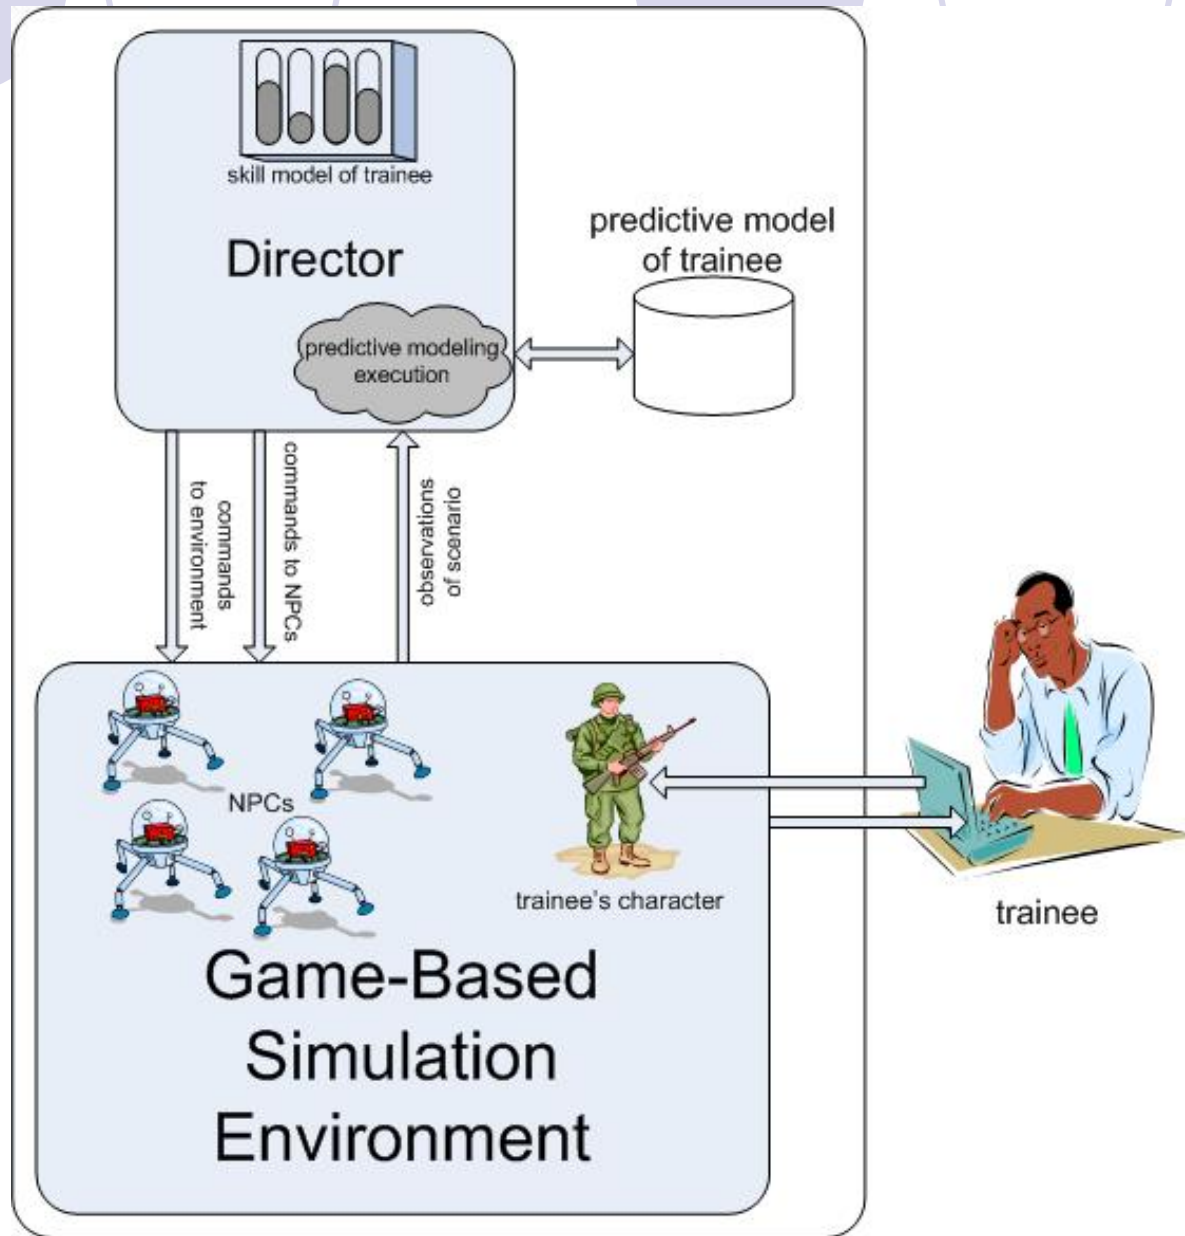

Tactical Combat
Casualty Care (TC3)

Architecture

Scenario representation

- Scenario

- Partially-ordered abstract scenes

- Mapping between possible actions and skills F1

- Scene

- Explicit list of skills tested

- Abstract events

F1

?

Fish, 6/15/2005

Director Actions

- Reactive & Predictive direction
 - Similar to IDA
 - React to trainee actions (provide feedback)
 - Anticipate trainee actions and structure events to ensure desired outcomes
- Skill-based direction
 - Take actions that allow trainee to demonstrate skills
- Heuristic scene choice & instantiation
 - Decisions motivated by skills & narrative arc

Skill-based direction

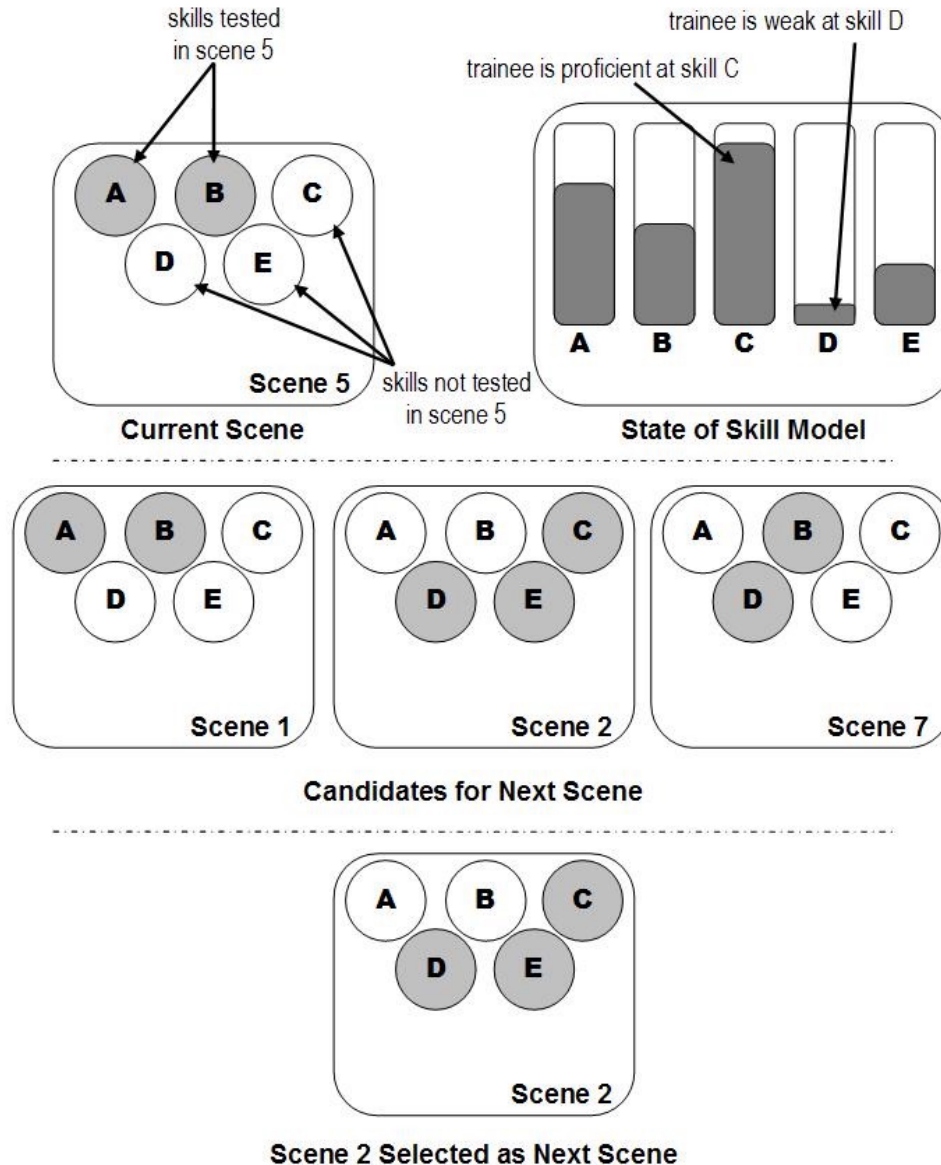

- Provide indirect environment feedback to trainee during task performance
 - Constraints
 - Maintain engagement: No “instructor popups”
 - Provide guidance (scaffolding) but don’t make it a crutch (fading)
 - Need multiple levels of intercession for the same trainee actions
 - Direction based on fⁿ of recency, strength, decay, & ?? of skill
- Example
 - Trainee fails to check civilian casualty for booby traps
 - Possible director actions:
 - Blow up trainee, roll out dud grenade, CO yells, NOP

Skills in 91W TC3

Skills	Description
<i>Care Under Fire</i>	In a hot zone situation, return fire and help secure the area before attempting treatment or extraction.
<i>Find Temporary Fighting positions</i>	Minimize exposure to fire by staying low to ground and using objects in the environment.
<i>Prioritize casualties</i>	Decide the order in which patients should receive care.
<i>Secure casualty</i>	Make sure the casualty poses/can pose no threat.
<i>Check vitals</i>	Check casualty's breathing, heart beat, and skin color.
<i>Apply tourniquet</i>	Decide when a casualty/situation requires a tourniquet and apply the tourniquet.
<i>Manage airway</i>	Open airway if the patient's breathing is labored.
<i>Manage chest wound</i>	Take correct steps to treat a casualty with a chest wound.
<i>Monitor</i>	Monitor casualty until evacuation
<i>Extraction</i>	Properly extract a casualty from a hot zone.

Heuristic Scene Choice

Scene instantiation

- Skill model for content selection & refinement
 - Instantiate scene to test specific skills
 - Transition f^n from skills & content to complete scene
- E.g. in “the ambush scene:”
 - Trainee is untested in tourniquet skills
 - spawn an enemy on top of building with RPG

Next steps

- Full implementation in 91W TC3
- Research in robust predictive models
- Diagrammatic authoring & debugging tool
- Evaluation of approach & tools
- Implementation in other environments

Nuggets and Coal

- Nuggets

- Extended IDA to training domain
- New approach to teaching in unstructured, real-time domain
- Working prototype in 91W TC3 trainer
- Lots of interest (potential funders/customers!)

- Coal

- Skill model is immature
- Scene representation & instantiation is immature
- Lack of other environments to show generalizability
